NOTES 04: CATEGORICAL VARIABLES

Stat 120 | Fall 2025 Prof Amanda Luby

1 Categorical Variables

Categorical variables are best summarized with a frequency table and visualized using a barplot. When we want to summarize a categorical variable with a single number, we often use a proportion.

When we have two categorical variables, we often use a two-way table to summarize them at the same time (also called the joint distribution). We might also care about the marginal distribution (the margins) or conditional distribution (a specific row/column).

Example: Below is the two-way table for our class representing the answers to "Have you taken a CS class before?" and whether the "Environmental Issues" interest box was checked.

	Week 1	Week 7
Yes (Got Sleep)	10	4
No (Not enough sleep)	6	9

- a. What is the marginal distribution of Sleep?
- b. What is the conditional distribution of Week among those who did not get enough sleep?
- c. What is the conditional distribution of Sleep among those who were surveyed in Week 1?
- d. What is the proportion of students who were surveyed in Week 1?
- e. Does sleep appear to be independent of week?

2 Quantitative Variables

Quantitative variables are best visualized with a histogram or dotplot (depending on sample size)		
		nost about the shape and center. When we nber, we often choose the mean, median, or
Skewed Right	Symmetric	Skewed Left
<u> </u>	doowibo the combou of the distribu	tion. The three weet common are
	describe the center of the distribu	tion. The three most common are:
Mean		
Median
